

TICKLORE

Every ticket has a story

Business Plan & Investment Overview · Prepared for Prospective Investors · July 2026

Executive Summary

Ticklore is an NFT-based ticketing platform built around a simple idea: a ticket shouldn't be thrown away after the event — it should become a keepsake. Where existing NFT ticketing platforms compete on fraud prevention and resale control, Ticklore leads with sentimental and collectible value, a positioning that fits a much wider range of events than concerts alone: family reunions, benefit fundraisers, community gatherings, corporate events, and milestone celebrations.

The platform hides blockchain complexity from the end user entirely — attendees buy with a credit card and receive a ticket by email, with no wallet or crypto knowledge required. Every ticket is a one-of-one digital asset the owner keeps permanently, with the option to move it into a personal crypto wallet as that becomes more mainstream.

Ticklore is designed from day one as a general-purpose platform, not a single-vertical tool. The go-to-market plan is to prove the model with one real, well-chosen first event, then expand deliberately across event categories — reunions, fundraisers, concerts, and corporate gatherings all share the same core need: a ticket that means something after the night is over. We are raising a pre-seed round to fund initial development and our first live pilot event.

4+ TARGET EVENT CATEGORIES	3 FOUNDING TEAM MEMBERS	13 WK TECHNICAL BUILD TIMELINE
--------------------------------------	-----------------------------------	--

The Market Opportunity

Industry research places the global online event ticketing market in the range of roughly \$60-90 billion in 2026, growing at a mid-single-digit to low-double-digit CAGR depending on the source. Ticklore is not targeting this entire market — it is targeting an underserved wedge within it.

Large platforms (Ticketmaster, AXS, Eventbrite) are built for scale — major venues, national tours, high-volume events — and are not designed around, or particularly attentive to, small nonprofits, family gatherings, or community organizers.

Existing NFT ticketing platforms (GET Protocol, YellowHeart, SeatlabNFT) target concerts and festivals specifically, competing on fraud prevention and resale royalties — a pitch that has limited resonance outside live music.

Ticklore's wedge is the large, fragmented long tail of smaller organizers — reunions, galas, community events, corporate gatherings — who are underserved by both categories above, combined with a keepsake-first positioning that no competitor currently owns.

Note for investors: the figures above are drawn from third-party market research reports and are presented as directional context, not a bottoms-up projection of Ticklore's addressable revenue. A detailed TAM/SAM/SOM model specific to Ticklore's target segments should be built out as part of due diligence.

Why Now

- NFT ticketing infrastructure (minting, wallet-abstraction tools, low-fee networks) has matured enough that a small team can build a production-grade product without deep blockchain R&D.
- Consumer wallet adoption is trending upward; building optional self-custody in now positions Ticklore ahead of that curve rather than retrofitting for it later.
- No incumbent — large or NFT-native — currently owns the "keepsake" positioning for non-concert events, leaving a clear, defensible wedge open.

The Problem

- Paper and PDF tickets are disposable — no lasting record of the event exists once the night is over.
- Ticket fraud and duplication remain persistent problems for organizers of all sizes, especially smaller nonprofits and community groups without access to enterprise ticketing tools.
- Nonprofits and community organizers are underserved by major platforms like Ticketmaster, which are built for scale, not for a 200-person gala or a family reunion.
- Donors increasingly want transparency into where their money goes — most nonprofit ticketing and giving tools don't provide a verifiable, permanent record of fund allocation.
- Existing NFT ticketing platforms (GET Protocol, YellowHeart, SeatlabNFT) lead with fraud prevention or resale royalties — a value proposition that resonates with concert promoters but means little to a family planning a reunion or a nonprofit running a gala.

The Solution — Ticklore

Ticklore is a ticketing platform where every ticket minted is a unique digital asset (NFT) that the buyer keeps permanently, positioned first and foremost as a keepsake rather than a financial instrument. Three principles guide the product:

Invisible blockchain. Buyers pay with a card and receive their ticket by email or app. No wallet setup, no crypto purchase, no technical friction.

One of one. Every ticket is a unique record — event, date, seat or role, and (where relevant) the donation it carried — permanently tied to its holder.

Transparent by design. For fundraising events, the platform can show, in aggregate, how ticket-linked donations were used — a trust feature most nonprofit tools can't offer.

The Living Ticket — Before and After

The core differentiator in Ticklore's roadmap is a hybrid data model that lets a ticket's story keep growing after the event ends, without ever compromising the integrity of the original record. This is a vision-stage feature, planned for a later build phase once the core ticket contract is proven, but it fundamentally shapes how the product is designed from day one.

Before: the locked original

The moment a ticket is minted, its core facts — event, date, seat or role, and the attendee's identity — are written permanently and can never be altered or deleted. This is the ticket's "Chapter One," and it is the foundation the rest of the product depends on.

After: the growing addendum

Once the event has happened, the organizer can add new content to the ticket record — event photos, an attendee roster, highlights, or a closing note. These additions are append-only: new entries can be added, but nothing already on the record can be overwritten or removed. Each addition is timestamped, so the history of what was added and when becomes part of the permanent record itself.

Why this matters

This model turns each ticket into a genuine, growing keepsake rather than a static receipt — a family reunion ticket that shows the whole family's photos months later, or a fundraiser ticket that shows the outcome the donation helped fund. No existing NFT ticketing platform (GET Protocol, YellowHeart, SeatlabNFT) offers this; all of them treat the ticket as finished the moment the event ends. This is a meaningful, hard-to-copy differentiator worth protecting as the product matures.

A practical note: rich content like photos and detailed rosters is stored off-chain (via decentralized storage such as IPFS or Arweave) with only a permanent reference recorded on-chain, which is standard practice for NFTs and keeps the model both affordable and genuinely tamper-proof. Sensitive attendance data — for example, a private support-group or wellness event roster — would remain private or opt-in only, never public by default.

Business Model

Revenue streams

- Per-ticket platform fee — a small percentage or flat fee added to each ticket sold, paid by the organizer or passed to the buyer.
- Tiered organizer plans — free or low-cost for small community events (reunions, small nonprofits); paid tiers for higher-volume organizers needing custom branding, analytics, or donation-tracking dashboards.
- Optional secondary-market fee — a small royalty if a ticket is resold or transferred, common practice in NFT ticketing and a straightforward way to capture ongoing value.

Cost structure

- Smart contract development and blockchain gas costs (minimized by batching mints and choosing a low-fee network such as Base or Polygon).
- Platform hosting, payment processing, and customer support.
- Early-stage: primarily founder time plus the raise outlined in "The Ask" below, covering development, the first pilot event, and legal setup.

Roadmap

The build sequence is deliberately narrow-first: prove the model with one real, well-chosen first event before broadening across event categories.

Phase	Timeframe	Focus	Milestone
Phase 1	Now – Month 3	Learn the technical stack; build core ticket smart contract (event, tier, donation amount, used flag).	Working ERC-721 ticket contract deployed on testnet.
Phase 2	Month 3 – 5	Identify and secure a first pilot event; sell real tickets, wallet hidden from attendees, donation tracking where relevant.	First live event sold entirely on Ticklore.
Phase 3	Month 5 – 8	Refine based on pilot feedback; build organizer dashboard (event setup, ticket design, sales tracking).	Self-serve organizer tool, usable without our direct help.
Phase 4	Month 8 – 12	Open to a second and third organizer across two different event categories (e.g., a nonprofit and a family or community event) to test general fit.	3 organizers, 2+ event categories proven.
Phase 5	Year 2	Broaden marketing to additional categories (concerts, corporate, milestone events); build the post-event addendum feature (photos, rosters, highlights) on top of the proven contract.	Repeatable playbook for onboarding new organizer types; first "living ticket" pilot event.

Market & Competitive Landscape

The NFT ticketing space is not empty, but it is not crowded with our specific positioning. Established players (GET Protocol, YellowHeart, SeatlabNFT, DeFy Tickets) primarily serve concerts and large festivals, competing on fraud prevention and resale control. Ticketmaster and other majors have added token-gating features but aren't built for — and don't prioritize — small nonprofits or community organizers.

Ticklore's differentiation is twofold: (1) a keepsake-first pitch that resonates with a wider range of non-concert events, and (2) a transparency layer purpose-built for mission-driven fundraising, which none of the existing platforms lead with.

Risks & Mitigations

Risk	Mitigation
Donation-linked tickets imply tax-deductibility before a nonprofit partner's status is confirmed	Hold all tax-deductible messaging until a partner's 501(c)(3) status is confirmed; market the donation feature as transparent giving, not a tax benefit, until then
Marketing tickets as an investment or appreciating asset could raise securities concerns	Keep all messaging focused on sentimental and collectible value, never financial return or appreciation
General-purpose platform pitch dilutes focus and go-to-market clarity	Launch narrow with one strong first event as the proof point; expand to new categories only after the first playbook is proven

Risk	Mitigation
Sensitive attendance data (e.g., a private support group, a wellness event, a closed community gathering) could expose attendees if mishandled	No public attendance credentials by default for sensitive event categories; privacy-first design with no public wallet-to-identity linkage
Custodial wallet model could draw "not your keys, not your NFT" criticism from crypto-native users	Default to a custodial wallet for simplicity, but build in an optional self-custody export path from the start so ownership claims remain credible

Traction To Date

- Brand, product concept, and visual identity fully developed (name, logo, color system).
- Live, password-protected preview website built and deployed, showcasing the product vision and "living ticket" concept to prospective partners and investors.
- Three-person founding team assembled, spanning operations, business development, and technical build.
- Technical build underway: founder is actively learning Solidity and smart contract development, with the core ticket contract as the first hands-on build.

The Ask

Ticklore is raising a pre-seed round to fund initial technical development and our first live pilot event. The figures below are a starting proposal for discussion, not a finalized term sheet — actual terms, amount, and structure (SAFE, convertible note, or priced equity) will be finalized with counsel and in conversation with investors.

Use of Funds	Allocation	Detail
Technical development	~40%	Smart contract development, security audit, organizer dashboard build
First pilot event execution	~20%	Organizer incentives, support, and iteration based on real-world feedback
Legal & entity formation	~15%	Incorporation, cap table setup, investment documents, compliance review
Organizer acquisition & marketing	~15%	Outreach to second and third organizers across different event categories
Reserve / contingency	~10%	Buffer for unforeseen technical or legal costs

This raise is intended to fund Ticklore through the end of Phase 3 on the roadmap above (a working, self-serve platform with one proven pilot event), positioning the company for a larger seed round once organizer traction across multiple event categories is demonstrated.

Team

Ticklore is being built by a three-person founding team.

Alex Winfield — Founder & Builder. Background spanning military service, multi-site operations and distribution management, and early ecommerce entrepreneurship — currently learning Solidity and smart contract development from the ground up, with this project as the first real build.

Pat "Ozzy" Osbourne — Co-Founder. Bio to be added.

Allison Allred — Co-Founder. A mother, entrepreneur, and connector at heart, Allison brings deep experience in business operations, systems, and process optimization, along with a strong background in sales, client retention, and customer service. She's driven by bringing people together and building environments — and businesses — where people can flourish.
